

AML Policy Handbook (Training Mock-up)

Purpose

This fictional document is intended for workshops and demonstrations in Microsoft Copilot Studio. It illustrates the structure of an Anti-Money Laundering (AML) policy and should not be used for regulatory compliance.

1. Customer Due Diligence (CDD)

Verify customer identity, beneficial ownership, expected account activity, source of funds where required, and risk rating before onboarding.

2. Enhanced Due Diligence (EDD)

Apply enhanced controls for high-risk customers, PEPs, sanctions-adjacent cases, complex ownership structures, or unusual jurisdictions.

3. Transaction Monitoring

Monitor transactions for unusual behaviour including rapid movement of funds, structuring, mule account indicators, and inconsistent customer activity.

4. Alert Investigation

Document evidence, record analyst findings, escalate where necessary, and maintain an auditable decision trail.

5. Suspicious Activity Reporting

Escalate confirmed suspicions to the appropriate Financial Intelligence Unit according to local regulation. Preserve confidentiality.

6. Record Retention

Maintain customer records, investigation notes, and decisions according to applicable legal retention requirements.

7. Governance

First Line: Operations. Second Line: Compliance. Third Line: Internal Audit. AI copilots support but never replace human judgement.
